We hereby withdraw our preprint "*Distributed alpha networks underlie individual differences in memory performance*". Upon review of analysis code, we discovered that Session C memory scores and oscillatory networks were misaligned. Remedying this, we no longer observed an association between alpha network structure and memory performance during this session. Consequently, at present no evidence exists for a trait-like relation between said networks and memory across recording sessions, and, with the exception of trait-like memory performance as presented in Figure 2, we retract all results and conclusions presented in this manuscript.
