16	Short title: Blood brain barrier transcripts and male courtship

#### 17 Abstract

18 The blood brain barrier (BBB) forms a stringent barrier that protects the brain from 19 components in the circulation that could interfere with neuronal function. At the 20 same time, the BBB enables selective transport of critical nutrients and other 21 chemicals to the brain. Many of these processes are still poorly understood. Beyond 22 these functions, another recently recognized function is even less characterized, 23 specifically the role of the BBB in modulating behavior by affecting neuronal 24 function in a sex dependent manner. Notably, signaling in the adult *Drosophila* BBB 25 is required for normal male courtship behavior. Courtship regulation also relies on 26 male-specific molecules in the BBB. Our previous studies have demonstrated that 27 adult feminization of these cells in males significantly lowered courtship. Here, we 28 conducted microarray analysis of BBB cells isolated from males and females. 29 Findings revealed that these cells contain male- and female-enriched transcripts, 30 respectively. Among these transcripts, nuclear receptor DHR3/Hr46 was identified 31 as a male-enriched BBB transcript. DHR3/Hr46 is best known for its essential roles 32 in the ecdysone response during development and metamorphosis. In this study, we 33 demonstrate that DR3/Hr46 is specifically required in the BBB cells of mature males 34 for courtship behavior. The protein is localized in the nuclei of sub-perineurial glial 35 cells (SPG), indicating that it might act as a transcriptional regulator. These data 36 provide a catalogue of sexually dimorphic BBB transcripts and demonstrate a 37 physiological adult role for the nuclear receptor DH3/Hr46 in the regulation of male 38 courtship, a novel function that is independent of its developmental role.

39

#### 40 Author summary

41	The blood brain barrier very tightly regulates which molecules can enter the brain.
42	This is an important protection for the brain, however, it also complicates
43	communication between molecules in the circulating fluid and the brain. In fly
44	courtship, for example, circulating male-specific products are crucially required for
45	normal courtship. But the neuronal circuits that ultimately control the behavior are
46	inside the brain, separated from these molecules by the blood brain barrier. The
47	mechanisms of this communication are not known. Here we show that the blood
48	brain barrier itself contains sex-specific RNAs and we show that one of them, a
49	nuclear receptor called DHR3, is required in adult males for normal courtship. These
50	findings promise new insight into the communication between blood brain barrier
51	and the brain.

52

#### 53 Introduction

It is well established that the two layers of glial cells that tightly surround the nervous system form the *Drosophila* blood brain barrier (BBB)(1). Flies have a nonvascular open circulatory system that distributes the hemolymph. The BBB forms the tight exclusion barrier that is essential to protecting neurons from hemolymph components that could interfere with neuronal function (2, 3). At the same time, the barrier needs to allow selective uptake of nutrients and other molecules needed for

60 brain function. The Drosophila blood brain barrier (BBB) surrounds the brain like a 61 tight cap. It consists of two layers of glial cells. The outer perineurial glia cells (PG 62 cells) are thought to function as a barrier for large-molecular weight molecules. The 63 inner layer, the subperineurial glia (SPG), is adjacent to the neuronal cell bodies and 64 contains the tight junctions that form the physical barrier (Fig 1A). It has been 65 shown in a number of genetic and functional studies that the barriers in flies and 66 vertebrates share not only structure and function, but also many homologous 67 proteins that ensure their function, as shown in (4). A recent microarray study of 68 isolated BBB cells has expanded on these earlier findings and shown that besides 69 the characteristic barrier proteins, fly and mouse BBB cells share a large number of 70 conserved proteins (5). That study has also provided the first detailed "inventory" of 71 these cells in *Drosophila*. While the barrier and selective uptake functions of the BBB are its most obvious essential function, evidence is starting to accumulate that other 72 73 physiological processes in BBB cells are contributing to brain function. For example, the G-protein-coupled receptor *moody* is specifically expressed in the subperineurial 74 75 glial cells (SPG)(6, 7). While the absence of both *moody* isoforms leads to a leaky 76 BBB (6, 7), mutants with only one of the isoforms have intact barriers, but 77 behavioral defects in their response to cocaine and alcohol (6). In addition, *moody*, 78 in a function independent of its function in barrier integrity, is also required in BBB 79 cells for normal male courtship (8). That active signaling processes in BBB cells 80 regulate neuronal output was further indicated by the finding that BBB-specific 81 reductions in the G protein Galpha(o) cause courtship defects, while leaving the 82 barrier integrity intact (8). It has been found that the circulating hemolymph

83	contains male-specific factors from the fat body that are needed to ensure normal
84	courtship (9). It is not clear how these factors interact with the male brain circuits
85	that regulate the behavior. Here we examine whether the BBB expresses sex-
86	specific transcripts that might be part of this communication. This would be in
87	agreement with the finding that feminization of the BBB by expression of the
88	feminizing TRA protein specifically in the BBB of adult males results in a significant
89	reduction in male courtship (8). In these experiments, the tightness of the barrier
90	was unaffected, suggesting that specific male transcripts are physiologically
91	participating in courtship control. The identity of these factors and their function is
92	unknown. Here we identify sex-preferentially expressed transcripts in the BBB of
93	males and females and demonstrate that the nuclear receptor DHR3/Hr46, best
94	known for its roles in larval development (10-12), is physiologically required in the
95	BBB of adult mature males to ensure normal male courtship behavior.
96	

### 97 **Results**

### 98 <u>A microarray screen identifies male- and female-enriched transcripts in the BBB</u>

99 In our previous experiments, there was a strong reduction in male courtship when 100 we conditionally feminized adult BBB cells (8). This suggests that feminization 101 disrupts male-specific transcripts that are physiologically required for normal 102 mating behavior. In order to identify these transcripts, we isolated BBB cells from 103 males and females and characterized their transcripts. The Gal4/UAS system was 104 used to mark these cells (13). We expressed the fluorescent protein DsRed in the

105	nuclei of SPG cells, using the <i>moody-Gal4</i> driver that drives expression in SPG cells
106	(SPG-Gal4) (6). As seen in Fig 1B, the large nuclei of the SPG cells were specifically
107	marked. We dissected fly brains and manually removed and collected fluorescent
108	cells. Cells from approximately 50 flies were pooled for each biological replicate,
109	and the RNA of three biological replicas from separate crosses was prepared for
110	each sex. The RNA was subsequently used for microarray analysis by GenUs
111	Biosystems (http://www.genusbiosystems.com/). The results confirmed the
112	presence of sex-preferentially expressed transcripts in the BBB of males and
113	females, respectively. 284 transcripts were identified that were enriched > 2 fold in
114	either males and females (Figures 2C, D). Of those, 112 were male-preferentially
115	expressed (S1 Table). As expected, the male-specifically expressed rox RNAs that are
116	required for dosage compensation were highly specific to males. Furthermore, sex-
117	specific <i>dsx</i> transcripts were identified because male and female transcripts use
118	different polyA-sites and can thus be identified by microarray (14). An analysis of
119	the GeneOntology of the enriched transcripts is shown in Table S2. Sex specific
120	categories such as dosage compensation and sex determination are well
121	represented, further confirming that the isolated cells are sexually determined.
122	About half of the genes fall into one of these categories. The rest of the genes could
123	not be assigned to a specific category. In addition to identifying sex-preferentially
124	expressed RNAS, the experiment also provided an inventory of RNAs present in the
125	BBB cells. The vast majority of BBB transcripts is equally expressed in males and
126	females. Among them, as predicted for SPG cells, were RNAs that are characteristic
127	of BBB cells (4, 5): RNAs for the junction proteins <i>sinu</i> and <i>neurexin</i> , for example,

128	and the previously characterized SPG transcripts for <i>moody</i> and <i>Mdr65</i> . The most
129	likely contaminating cells from the dissections would be fat body cells which are in
130	close proximity to the BBB, and neuronal cells. We found very small amounts of the
131	fat body transcript <i>Lsp-2</i> , or of the neuronal marker <i>elav</i> . They were not
132	preferentially present in males or females, indicating that low amounts of these cells
133	are unlikely to affect the identification of sex-specific transcripts in the BBB.
134	
135	The nuclear receptor DH3/Hr46 is required in the BBB for courtship
136	One of the male-enriched BBB RNAs is the transcript for the nuclear receptor
137	DHR3/Hr46 (Fig 1E). DHR3/Hr46 is an orphan nuclear receptor that is most related
138	to the mammalian ROR receptor (Retinoic acid related orphan receptor).
139	DHR3/Hr46 is a well-described transcriptional regulator of larval developmental
140	processes in response to ecdysone, but no adult functions have been described so
141	far. To examine whether <i>DHR3/Hr46</i> is required in the BBB for courtship we
142	conditionally expressed two different DHR3/Hr46-RNAi constructs specifically in the
143	BBB of mature adult males and examined their courtship (Fig 2). Male courtship in
144	Drosophila melanogaster consists of well-defined stereotyped behavioral steps that
145	can easily be quantified in a courtship index (CI) (15-17). The CI is calculated as the
146	fraction of time the male spends displaying any element of courtship behavior
147	(orienting, following, wing extension, licking, attempted copulation, copulation)
148	within a 10 minute observation period (18). We used the <i>Gal4/Gal80</i> <sup>ts</sup> system to
149	restrict knockdown to mature males (19). Two different BBB-Gal4 drivers were
150	used to direct expression, the previously described SPG-Gal4, and a SPG-cell-specific

151 *Mdr65-Gal4* driver that was generated in our lab (Fig 2D). The ATP binding cassette 152 (ABC) transporter *Mdr65* has been shown to be specifically expressed in the SPG 153 cells of the BBB (20, 21). Control flies containing a copy of just one of the two 154 respective transgenes were grown, treated and tested in parallel to the knockdown 155 flies as controls. At 18°C, Gal4 is inhibited by Gal80ts, and DHR3/Hr46-RNAi is not 156 expressed. At this temperature, all genotypes exhibited normal courtship. In 157 contrast, following induction at 32°C, males expressing *DHR3/Hr46-RNAi* in the BBB 158 had significantly reduced courtship (p<0.001) (Figs 2A, B). Reduction was observed 159 with both drivers in combination with either of two different UAS-DHR3/Hr46-RNAi 160 constructs. While courtship was reduced, the males were capable of performing all 161 of the steps of courtship, but they did so with lower probability. To eliminate 162 general sickness of the males as a cause for the reduced courtship, we performed a 163 short-term activity assay (22) and found no activity defects in the knockdown flies 164 (Fig 2C). We conclude that *DHR3/Hr46* is required in the BBB of mature males for 165 normal courtship behavior. SPG BBB cells are glial cells. To confirm the glial 166 requirement for DHR3/Hr46 we used the glia-specific driver *repo-Gal4* to drive UAS-167 *DHR3/Hr46-RNAi* in adult males and observed equally reduced courtship (p<0.001) 168 (Fig 3A). As expected, when we expressed DHR3/Hr46-RNAi in the BBB with Mdr-169 *Gal4* in the presence of a glial-expressed Gal80 blocker (*repo-Gal80*) (23) we 170 observed a reversal of the courtship defects. Together our findings demonstrate that 171 *DHR3/Hr46* is needed in the glial SPG cells for normal courtship. 172 To assess whether DHR3/Hr46 knockdown affects the integrity of the BBB, we 173 tested the tightness of the BBB by injecting 10kD Texas-Red (TR)-marked Dextran.

174	It is well documented that in wildtype animals TR-Dextran will be kept out of the
175	brain and accumulate at the BBB, whereas a leaky BBB would allow entry into the
176	brain (6). As shown in Fig 3E, males expressing <i>DHR3/Hr46</i> RNAi have normal BBB
177	barrier function with the dye accumulating at the barrier. These findings indicate
178	that BBB integrity is not compromised in the mutants, giving support to a
179	physiological function for <i>DHR3/Hr46</i> in the BBB that is required for normal
180	regulation of courtship.

### 182 DHR3/Hr46 and its ligand are present in SPG nuclei

- 183 To examine the intracellular distribution of DHR3/Hr46, we used antibodies
- 184 generated by the Thummel lab (11) to study the protein distribution in SPG cells of
- 185 mature animals (Fig 4). Indy-GFP was used as a BBB marker; it is expressed in both
- 186 PG and SPG cells (5). DNA was labeled with DAPI. BBB cells are big flat cells with
- 187 large polyploid nuclei (24). Anti-DHR3/Hr46 antibody staining detected
- 188 DHR3/Hr46Hr46 in the cytoplasm and the nucleus of SPG cells (Figs 4 A-D).
- 189 DHR3/Hr46 is a transcriptional activator in larvae, and its presence in the nucleus
- 190 of BBB cells is consistent with a transcriptional role in these cells.
- 191 DHR3/Hr46 belongs to the family of ligand activated nuclear receptors. And while
- 192 its ligand is unknown, insertion of the putative ligand binding domain into the Gal4
- 193 activation domain results in the transcriptional activation of Gal4 in cells containing
- 194 the putative ligand. Palanker et al. have shown that this construct recapitulates
- 195 Hr46 activation in cells where Hr46 transcriptional activity has been observed (25).

196	Binding of the putative ligand activates $Gal4^{LBD(DHR3)}$ whose activity can then be
197	visualized by a UAS- reporter. Importantly, in the construct, the $Gal4^{LBD(DHR3)}$
198	reporter is driven by a <i>hsp70</i> heat shock promoter ( <i>hsp70- Gal4<sup>LBD(DHR3</sup></i> ). This makes
199	it possible to interrogate the presence of the ligand at a time of choice. We induced
200	the <i>Gal4</i> <sup>LBD(DHR3)</sup> ligand sensor in mature males by exposing the flies to 37 degrees
201	Celsius for one hour and fixed their brains four hours later. We combined <i>hsp70-</i>
202	<i>Gal4<sup>LBD(DHR3</sup></i> with <i>UAS-dsRed</i> to visualize Gal4 activity, and <i>indy-GFP</i> for visualization
203	of the BBB. As shown in Figs 4 E-G, dsRed staining is observed in the large nuclei of
204	SPG cells, indicating that the ligand for Hr46 is present in these cells in adult mature
205	males. Together our findings support a scenario in which Hr46 is activated and
206	physiologically needed in the cells of adult males to support normal male courtship
207	behavior.

#### 209 Discussion

210 Our microarray screen revealed that the Drosophila BBB contains male-enriched 211 transcripts in males, as well as female-enriched transcripts in females. We have 212 previously observed a reduction in male courtship when we conditionally feminized 213 the BBB cells of mature males. Together these findings suggest that sex-specifically 214 enriched transcripts contribute to a "male-specific" state of BBB cells that shapes its 215 physiology and its dynamic interaction with the brain to modulate courtship. The 216 previous feminization experiments were done in mature adult males by conditional 217 induction of the female-specific TRA protein (26). TRA is a master controller of sex

218	determination by virtue of its direct control of the two major sex specific
219	transcription factors DSX and FRU, which in turn control a multitude of genes (27,
220	28). Non-induced males were normal, demonstrating that it was the acute adult
221	change in transcripts that resulted in disturbed courtship. In the microarray
222	experiments described here we sampled all transcripts that were present in the BBB
223	cells of mature males and females. These animals were of the same age as the flies in
224	the TRA induction studies. Neither males nor females had mating experience. The
225	sex-specific transcripts we identify here therefore likely include transcripts that
226	were affected in the feminization experiment.
227	We identified a total of 284 sex-preferentially expressed transcripts. It is likely that
228	a number of them are required in the regulation of sex-specific behaviors and that
229	their disruption will affect courtship. Identifying them holds the promise of insight
230	into the physiological processes that underlie BBB-brain communication that is
231	required for normal courtship. However, there will likely also be commonly
232	expressed transcripts that participate in these sex-specific processes as they
233	interact with sex-specific partners or regulators, or respond to sex-specific incoming
234	signals. The majority of identified SPG transcripts are equally expressed in males
235	and females, representing an insight into the overall transcriptional "makeup" of
236	SPG cells of mature males and females. We expect many of them to overlap with the
237	transcripts identified by deSalvo et al. (5). In contrast to our study, their
238	characterization included both layers of the BBB, PG and SPG cells, without
239	distinguishing between males and females.

240 DHR3/Hr46 belongs to the nuclear-receptor superfamily that is characterized by the presence of a highly conserved DNA-binding domain (DBD) and a less conserved 241 242 C-terminal ligand-binding and dimerization domain (LBD). The ligand for 243 DHR3/Hr46 is unknown, but the reporter construct made by Palanker et al. strongly 244 indicates that a ligand exists that binds to the LBD in the receptor (25). In larvae, 245 Palanker et al. observed fairly widespread, but not ubiquitous, activation, including 246 in the fat body, leading to the speculation that DHR3 might have metabolic 247 functions, ROR, the mammalian homologue of DHR3, is known to bind cholesterol 248 and play a role in lipid homeostasis. Flies do not produce cholesterol, but take it up 249 from their diet and it is an important precursor for the steroid ecdysone among 250 other roles. Another nuclear receptor, DHR96 has been shown to bind cholesterol in 251 *Drosophila* and to be essential for cholesterol homeostasis (29), but this does not exclude a role for DHR3/Hr46. Palanker et al. observed strong Gal4<sup>DHR3LDB</sup> reporter 252 253 expression in tissues of late third instars, with expression dropping in pre-254 pupariation, but strong activation was observed again in late pupae. We show here 255 activation of the reporter construct in the BBB of mature adult males. In these 256 experiments, the reporter construct is conditionally induced by a heat pulse in 257 mature males. Thus, the observed activation reflects a "snapshot" of the presence of 258 the putative ligand at that time. The observed activity coincides with the time when 259 knockdown of DHR3 causes a reduction in courtship. 260 DH3/Hr46 is best known for its essential role in development as an ecdysone 261 effector. It is activated by ecdysone and is a part of an activation cascade in response

to ecdysone. It induces another nuclear receptor, Ftz-F1, among numerous other

263 genes. Eventually, it acts as a negative feedback regulator to turn off ecdysone-264 receptor signaling (10-12, 30, 31). DHR3/Hr46 has essential functions during 265 embryogenesis, prior to molts, and at the onset of metamorphosis. To our 266 knowledge, this is the first report of an adult non-developmental role for 267 DHR3/Hr46. Our conditional knockdown experiments demonstrate that its 268 presence in the BBB of mature males is needed for normal courtship. Whether this 269 reflects a role for an ecdysone-induced signaling cascade and transcriptional 270 activation of downstream targets remains to be determined. Data from (32) suggest 271 that ecdysone and the ecdysone receptor (EcR) are present in the BBB. We have 272 likewise found in our screen that *EcR* and *ftz-F1* RNAs are present in SPG cells in a 273 non-sex-specific manner. In analogy to its developmental role, DHR3/Hr46 most 274 likely acts as a transcriptional regulator. Our observation that the Hr46 protein is 275 present in SPG nuclei supports this interpretation. However, in an unexpected 276 finding Montagne et al have identified DHR3 as a S6K interacting protein in late 277 larvae/prepupae (33). Intriguingly, this function required a novel form of DHR3 that 278 did not contain the DNA binding domain, but did require the ligand binding domain. 279 The presence of this altered form of DHR3 increased phosphorylation activity of 280 S6K. This finding, together with the short time scale of the response led the authors 281 to propose an alternative non-genomic role of DHR3, possibly as a mediator of the 282 metabolic state of these cells. We do not know whether this isoform plays a role in 283 courtship and whether DHR3 might have a role that is independent of EcR in the 284 BBB, conceivably in addition to the transcriptional role that is suggested by its 285 presence in the nucleus.

286	Taken together, the data presented here demonstrate an adult physiological role for
287	DHR3/Hr46, a nuclear receptor mainly known for its crucial function in
288	development , in the glial cells of the BBB where it is required for the regulation of
289	normal male courtship.

303	repo-Gal80 flies (23) were a gift from Christian Klämbt (University of Münster).
304	w <sup>1118</sup> ; P{w[+mC]=hs-GAL4-DHR3.LBD was a gift from Carl Thummel (University of
305	Utah).
306	<u>Gal80<sup>ts</sup> experiments</u>
307	<i>tubP-Gal80</i> <sup>ts</sup> carrying flies and control flies were raised at 18°C. Virgin males were

308 collected at eclosion and kept in individual vials for 5–8 days at 18°C. Flies were

309	then placed at 32°C for 24 hours for induction. Following induction, induced and
310	uninduced flies were kept at 25°C overnight prior to courtship assays.
311	
312	Behavioral assays
313	The courtship assay and activity assay were performed as previously described
314	(34). In short, males were placed in a plexiglass "mating wheel" (diameter 0.8 cm),
315	together with a 2–4 hrs old <i>Canton-S</i> virgin female. The courtship index was
316	calculated as the fraction of time the male spent displaying any element of courtship
317	behavior (orienting, following, wing extension, licking, attempted copulation,
318	copulation) within a 10-minute observation period (18). Short-term activity assays
319	were performed as previously described (22). Individual males were placed into the
320	"mating wheel" containing a filter paper with a single line dividing the chamber in
321	half. After 2–3 minutes of acclimation time, the number of times the male crossed
322	the center line within the three-minute observation time was counted.
323	Each graph represents sets of control and experimental genotypes that were grown,
324	collected, aged and tested in parallel. In each behavioral session, equal numbers of
325	all genotypes were tested.
326	

327 <u>Microarray analysis</u>

To isolate blood-brain barrier cells, flies bearing the *SPG-Gal4* driver were crossed to flies carrying the fluorescent reporter transgene, *UAS-DsRed*. This resulted in the expression of the visible fluorescent marker DsRed to mark the nuclei of BBB cells. Prior to the experiment, both the driver *SPG-Gal4* and the *UAS-DsRed* lines were

332 outcrossed with a Cantonized  $w^{1118}$  strain for 10 generation. The flies were grown in 333 a 25°C incubator under a 12hrs light/12hrs dark cycle. Eclosing males and females 334 were collected and kept in separate groups of 10-15 flies of the same sex under the 335 same conditions for 4 days and then dissected between ZT 5 and ZT 7 to control for 336 levels of cycling transcripts. Equal numbers of males and females originating from 337 the same culture were dissected in each sitting. The brains were dissected in ice-338 cold 1 X PBS. The dissected brains were then transferred to a new petri dish 339 containing ice-cold 1X PBS within half an hour. Carefully, under the fluorescent 340 microscope, individual and/or groups of blood-brain barrier cells marked with 341 DsRed were isolated manually by using Dumont # 5 SF superfine forceps (Fine 342 Science Tools, Inc). The cells were then immediately transferred to a frozen droplet 343 of Trizol reagent on dry ice and stored in -80°C until further processing. Cells were 344 isolated from at least 50 brains for each genotype. The approximate total number of 345 cells isolated per brain varied from ~60-120. The forceps were cleaned with 346 RNAZap when moving from one genotype to the other. 347 The isolated BBB cells of male and female flies were provided to GenUs Biosystems 348 (http://www.genusbiosystems.com/) for microarray analysis. A total of 3 biological 349 replicates for males and females were submitted. Cells were lysed in TRI reagent 350 (Ambion) and Total RNA was isolated using phenol/chloroform extraction followed 351 by purification over RNeasy spin columns (Qiagen). The concentration and purity of 352 Total RNA was measured by spectrophotometry at OD260/280 and the quality of 353 the Total RNA sample was assessed using an Agilent Bioanalyzer with the RNA6000

354 Nano Lab Chip (Agilent Technologies). Labeled cRNA was prepared by linear

355	amplification of the Poly (A)+ RNA population within the Total RNA sample. Briefly,
356	$1~\mu g$ of Total RNA was reverse transcribed after priming with a DNA oligonucleotide
357	containing the T7 RNA polymerase promoter 5' to a dT(24) sequence. After second-
358	strand cDNA synthesis and purification of double-stranded cDNA, in vitro
359	transcription was performed using T7 RNA polymerase. The quantity and quality of
360	the cRNA was assayed by spectrophotometry and on the Agilent Bioanalyzer. One
361	microgram of purified cRNA was fragmented to uniform size and applied to
362	Drosophila (V2) Gene Expression microarray (Agilent Technologies, Design ID
363	021791) in hybridization buffer. Arrays were hybridized at $37^\circ$ C for 18 hrs in a
364	rotating incubator, washed, and scanned with a G2565 Microarray Scanner (Agilent
365	Technologies). Arrays were processed with Agilent Feature Extraction software and
366	data was analyzed with GeneSpring GX software (both Agilent Technologies). To
367	compare individual expression values across arrays, raw intensity data from each
368	gene was normalized to the 75th percentile intensity of each array. Genes with
369	values greater than background intensity in all female or all male replicates were
370	filtered for further analysis. Differentially expressed genes were identified with fold
371	change > 2-fold and Welch Ttest, p-value < 0.05.
372	The data discussed in this publication have been deposited in NCBI's Gene
373	Expression Omnibus and are accessible through GEO Series accession number GSE

- 374 157122 (https://www.ncbi.nlm.nih.gov/geo/query/acc.cgi?acc=GSE157122).
- 375

## 376 <u>Generation of Mdr65-Gal4 transgenic flies</u>

- 377 650 bp of sequence upstream of the *Mdr65* coding sequence was PCR amplified from
- 378 *CS* genomic DNA using the primers
- 379 *5'cggaattc*(EcoRI)*TCCATCACTTAGCAAAGCAGACTTCAATC* and 5'cgggatcc(BamH1)
- 380 *GGTGATGTTTAGTCGGCACTGACGA* and inserted into the *Drosophila* transformation
- 381 vector *pGATN* to create *Mdr65-Gal4*. In *pGATN*, expression of the yeast transcription
- factor Gal4 is driven by the inserted promoter sequences (13). Transgenic flies were
- 383 generated by Rainbow Transgenic Flies (https://www.rainbowgene.com/) by P-
- 384 element mediated insertion. The expression pattern in *Mdr65-Gal4* transgenic lines
- 385 was examined by crosses to *UAS-dsRed* (nuclear) or *UAS-mcD8-dsRed*.

386

#### 387 Immunohistochemistry

- 388 Immunohistochemistry on isolated brains was performed as described in Li et al.
- 389 (35). The DHR3/Hr46 antibody was a gift from Carl Thummel, University of Utah
- 390 (11) and was used at 1:50 dilution. To visualize BBB cells, flies carrying *Indy-GFP*
- were used for anti-DHR3/ anti-GFP double staining. *Indy-GFP* marks BBB cells (36).
- 392 Antibodies used:
- Rabbit anti-DHR3, 1:50 (gift of Carl Thummel, University of Utah (11)); Rabbit anti-
- 394 RFP (abcam ab62341), 1:200; chicken anti-GFP (abcam ab13970), 1:500; Alexa
- Fluor 555 goat anti-rabbit (Invitrogen A21429) 1:200; Alexa Fluor 635 goat anti-
- 396 mouse (Invitrogen A31575) 1:200; Alexa Fluor 488 goat anti-chicken (Thermo
- 397 Fisher Scientific A-11039).

- 399 Injection of 10kd Dextran-TR to assess the integrity of the BBB was performed as
- 400 described in Hoxha et al. (8).
- 401
- 402 <u>Test for presence of DHR3/Hr46 ligand</u>
- 403 *hs-Gal4*<sup>LBD(DHR3)</sup> flies were crossed to UAS-dsRed(nuclear); indy-GFP flies. Progeny
- 404 were collected at eclosion and kept in small groups of males or females for 4 days.
- 405 Expression of *hs-Gal4*<sup>LBD(DHR3</sup> was induced by placing flies in prewarmed food vials at
- 406 37°C for one hour, followed by recovery at room temperature for three hours and
- 407 brain isolation. dsRed expression as a measure of Gal4 activation by DHR3 ligand
- 408 and GFP (as BBB marker) were assessed by immunohistochemistry.
- 409

#### 410 <u>Statistical Analysis</u>

- 411 Two-way analysis of variance (ANOVA) was used to establish overall significance.
- 412 Post hoc analysis for multiple comparisons was carried out with Tukey (HSD). P
- 413 values < 0.05 were considered statistically significant. All statistical calculations
- 414 were done using XLSTAT (Addinsoft, NY, NY) running on Microsoft Excel for Mac
- 415 (version 16). All ±error bars are standard error of the mean (SEM).
- 416
- 417
- 418 Figure legends

419 Figure 1. Microarray analysis of isolated SPG cells of the BBB. (A) Schematic of

- 420 the Drosophila Blood Brain Barrier (BBB) (modified from (37). The BBB consists of
- 421 two layers of glial cells, the outer Perineurial Glia (PG) facing the circulating
- 422 hemolymph, and the inner Subperineurial Glia (SPG) with septate junctions that

423	form the main barrier. The SPG is in contact with the underlying nuclei of the
424	neuronal cortex. (B) Isolated fly brain with SPG cells labeled by nuclear DsRed
425	expression driven by SPG-Gal4. Fluorescently marked cells like these from males
426	and females were hand-isolated for RNA extraction. (C) Probes present (above
427	background) in all male or female samples are displayed as normalized to the 75th
428	percentile intensity of each array (19,218 probes). Each spot is the mean of 3
429	samples from each condition. Black spots =differentially expressed genes (>2Fold,
430	T-test p-value < 0.05, 284 probes). Red/orange=High expression, Yellow=Medium
431	expression, Blue=Low expression. (D) Differentially expressed genes (>2 fold,T-test
432	p-value < 0.05) in Male vs. Female are displayed as normalized to the median value
433	of each probe across six samples (284 probes). The heat map color scale is shown on
434	the right. (E) DHR3/Hr46) is preferentially expressed in males.
435	
436	Figure 2. Knockdown of DHR3/Hr46 in the BBB of mature males reduces
437	courtship. Graphs show the courtship index CI (fraction of time males spend

438 courting during the observation period) <u>+</u> SEM (A, B), or the performance of males

in a control activity assay (# of line crossings <u>+</u> SEM) (C) of the indicated genotypes.

440 N= 20. Data were analyzed by ANOVA followed by Tukey multiple comparisons

441 (p<0.05). Indices that are significantly different from the controls are marked by

442 asterisks. UAS-Hr46i expression is restricted by the presence of tubP-Gal80ts at 18°C

443 (induction -). Placement of 5-day-old males at 32°C for 16-24 hours (induction +)

releases the Gal80 inhibition and leads to the expression of RNAi. (A) Expression of

445 two different UAS-Hr46-RNAi (1-line 27253 and 2-line 27254) using SPG-Gal4

446 significantly reduces male courtship. B) Conditional expression of UAS-Hr46i (27254) using *Mdr-Gal4* in adult males similarly reduces courtship in comparison to 447 448 controls. The controls are 1) +/Gal80ts;+/SPG-Gal4 and +/Mdr-Gal4; +/ Gal80ts, 449 respectively and 2) +; +/UAS-Hr46 RNAi. (C) The activity of the mutants as measured 450 by number of line crossings is not lower than in control flies.  $+/Hr46^{(1)}$  control flies 451 have reduced activity after induction that does not correlate with their courtship 452 index. (D) Mdr-Gal4 expression in SPG cells visualized by expression of UAS-dsRed in 453 dissected brain (red). For comparison, *indv-GFP* (green) is expressed in both PG and 454 SPG cells. (E) Blood-brain barrier integrity is not compromised in *Mdr-Gal4/UAS*-455 Hr46-RNAi males. Flies were injected with 10 kDa TR-Dextran (red) and dye 456 penetration into or exclusion from the brain was examined by confocal microscopy. 457 The brain nuclei are stained with DAPI. A tight BBB is indicated by the demarcated 458 red line on the surface of the brain indicating exclusion of TR-dextran from the brain 459 of *Mdr-Gal4/ UAS-Hr46-RNAi* males. 460 Figure 3. Hr46/DHR3 is required in the glial SPG cells for courtship. Graphs 461 462 show the courtship index CI (fraction of time males spend courting during the 463 observation period) + SEM. N= 20. Data were analyzed by ANOVA followed by Tukey 464 multiple comparisons (p<0.05). Indices that are significantly different from the

- 465 controls are marked by asterisks. (A) Conditional glial knockdown of *DHR3/Hr4*6 in
- 466 mature males using *repo-Gal4; Gal80*<sup>ts</sup> reduces courtship. (B) The courtship

467 reduction of *Mdr-Gal4* directed *DHR3/Hr4*6 knockdown can be reversed by Gal80

468 expression in glial cells directed by *repo-Gal80*.

470	Figure 4. DHR3/Hr46 protein is located in SPG nuclei, and a reporter construct
471	indicates that the DHR3/Hr46 ligand is present in the SPG cells of mature
472	males.
473	(A-D) Anti-DHR3 antibody staining (Red) shows the presence of DHR3 in the nuclei
474	and cytoplasm of SPG cells. Indy-GFP (green) marks BBB cells. Blue: DNA staining
475	(DAPI). (E-G) Activation of the <i>hs-Gal4</i> <sup>LBD DHR3</sup> reporter (25) indicates the presence
476	of the DHR3/Hr46 ligand in SPG cells. <i>hs-Gal4<sup>LBD DHR3</sup>/UAS-dsRed/indy-GFP</i> mature
477	males were heat-shocked to express <i>Gal4<sup>LBD DHR3</sup></i> . Following binding of DHR3 ligand,
478	Gal4 initiates transcription at UAS-dsRed(nuclear). dsRed can be seen expressed in
479	the characteristic large nuclei of SPG cells (red). <i>Indy-GFP</i> expression is used as a
480	BBB marker (green). Blue: DNA staining (DAPI, blue).
481	
482	S1 Table. Differentially expressed genes in BBB from males vs. females
483	(>2Fold, p<0.05). 284 transcripts were identified that differ by >2Fold (p<0.05). Of
484	those 112 were male-preferentially expressed, 172 were female-preferentially
485	expressed.
486	
487	S2 Table. Gene Ontology classifications of the 284 genes differentially
488	expressed in BBB Males vs. Females.
489	
490	Acknowledgements

491	We thank Dr. Carl Thummel for anti-DHR3 antibodies and fly lines and Takeshi
492	Awasaki (University of Massachusetts), Rob Jackson (Tufts University), Christian
493	Klämbt (University of Münster) and Gregg Roman (University of Mississippi) for fly
494	lines. We thank Calvin Do for help with brain dissections. We thank GenUS
495	biosystems for expert help with the microarray experiments.

# Overlap of 284 genes differentially expressed in BBB Males vs. Females with Gene Ontology classifications

Category=the name of the category within the ontology.

Genes in Category=the total number of genes in the genome that have been assigned to the category

Genes in List in Category=the total number of genes that are both in the selected gene list and in the category.

P-value=a hypergeometric p-value without multiple testing corrections.
