Abstract

JASPAR is a widely used open-access database of curated, non-redundant transcription factor binding profiles. Currently, data from JASPAR can be retrieved as flat files or by using programming language-specific interfaces. Here, we present a programming language-independent application programming interface (API) to access JASPAR data using the Representational State Transfer (REST) architecture. The REST API enables programmatic access to JASPAR by most programming languages and returns data in seven widely used formats. Further, it provides an endpoint to infer the TF binding profile(s) likely bound by a given DNA binding domain protein sequence. Additionally, it provides an interactive browsable interface for bioinformatics tool developers. The REST API is implemented in Python using the Django REST Framework. It is accessible at <http://jaspar.genereg.net/api/> and the source code is freely available at <https://bitbucket.org/CBGR/jaspar> under GPL v3 license.

1 Introduction

JASPAR (<http://jaspar.genereg.net>) is the largest open-access database of curated transcription factor (TF) binding profiles for TFs from six different taxa (Sandelin *et al.*, 2004; Mathelier *et al.*, 2016). The underlying JASPAR data, accessible as flat files, SQL tables, or in a R data package, has been used by numerous motif enrichment tools, data analysis pipelines, and several other bioinformatics software (Stormo, 2015). Over the years, programming language-specific packages have been developed in Perl (Lenhard and Wasserman, 2002), Python (Mathelier *et al.*, 2014), R (Tan and Lenhard, 2016), and Ruby (Mathelier *et al.*, 2016) to retrieve and process data from JASPAR. However, all of these tools are language-specific and most require connection to the MySQL database.

We developed a language- and platform-independent Application Programming Interface (API) to programmatically retrieve data stored in the JASPAR database using the Representational State Transfer (REST) architecture. REST (Fielding, 2000) is a well-recognized modern web service architecture, which uses HTTP protocol to send and receive data using uniform resource locators (URLs). This new JASPAR API provides an easy-to-use RESTful web services to query/retrieve data from the latest version of the JASPAR database. The API comes with programmatic and human browsable interfaces. The HTML-based browsable interface provides a useful means for developers to interrogate the RESTful API manually before implementation in their system. From the JASPAR RESTful API, TF binding profiles can be retrieved in seven different formats: JSON, JSONP, JASPAR, MEME, PFM, TRANSFAC, and YAML.

Khan, A. *et al.*

2 Implementation

The JASPAR RESTful API is implemented in Python using the Django REST Framework. The source code is freely available under GPL v3 license at <https://bitbucket.org/CBGR/jaspar>. We used Apache HTTP server as a gateway to the API and MySQL database for persistence storage and retrieval of data requested by API services.

2.1 JASPAR RESTful API overview

The RESTful API is interrogated through simple URLs to provide programmatic and human browsable interface to the JASPAR database. For instance, you can access information about the TF binding matrix associated with the CTCF TF at <http://jaspar.genereg.net/api/v1/matrix/MA0139.1> and get the PFM values in JASPAR format by using <http://jaspar.genereg.net/api/v1/matrix/MA0139.1.jaspar>.

To ensure no disruption in the applications and tools using the API, the API is version-based with the version included in the API's URL. New versions will be released with version number-based URLs, and there will be a prior notice before obsoleting any older versions. In order to control the rate of requests that clients can make to the API, we use throttling. It allows 25 requests per second from the same IP address, but no limit on the total number of requests. To enhance performance, we use Memcached (<http://memcached.org>), which is a fast, efficient, and fully memory-based cache server. Further, to provide a faster response to each request, the API provides pagination. The number of records per page can be modified by setting the *page_size* parameter (by default *page_size=10*). The *page* parameter is then used to request a specific page (see examples in Supplementary data). Additionally, the API supports simple query parameters to control ordering of results. For instance, one can set the parameter *order=name* to order TF binding profiles by name. The order can be reversed by prefixing the field name with '-' and multiple orderings may also be specified, separated by ',' (see Supplementary data for examples).

The RESTful API supports several data renderers to return responses with various media types. Currently, seven data formats are available for TF binding profiles: JSON, JSONP, JASPAR, MEME, PFM, TRANSFAC, and YAML. Users can set the output format in three different ways: (i) by setting a *<format>* parameter in the URL, (ii) by adding a *<format>* suffix to the URL, or (iii) by using the Accept headers in the get request (see Supplementary data for examples).

2.2 RESTful API endpoints

The RESTful API provides several endpoints to query and retrieve data from the JASPAR database (Tables 1 and S1). It also provides endpoints to infer the most likely TF binding profile(s) associated with a given protein sequence (Mathelier *et al.*, 2016). A summary of current API endpoints is available in Table 1 and a list of parameters to filter TF binding profiles from the */matrix* endpoint is provided in Tables 2 and S2.

Table 1: Summary of REST API endpoints

Method	Endpoint	Description
GET	/matrix	Gets a list of all profiles. *
GET	/matrix/:matrix_id	Detail view of the profile
GET	/matrix/:base_id/versions	List of profile versions
GET	/collection/:collection	List profiles in a collection
GET	/infer/:sequence	Infer profiles, given a protein sequence

* Profiles can be filtered using several parameters listed in Table 2 and Table S2.

Table 2: List of query parameters to filter profiles for API endpoint */matrix/*

Parameter	Description	Example
<i>search</i>	Anything to search	?search=Myc
<i>collection</i>	JASPAR collection name	?collection=CORE
<i>tax_group</i>	Taxonomic group	?tax_group=vertebrates
<i>class</i>	Transcription factor class	?class=Zipper-Type
<i>family</i>	TF family	?family=SMAD factors
<i>type</i>	Type of data/experiment	?type=SELEX
<i>version</i>	Get latest matrix version	?version=latest

A detailed documentation for each endpoint with sample calls in multiple programming languages (JavaScript, Perl, Python, R, Java, and Ruby, following (Yates *et al.*, 2015)) is available on the API website. Further, an interactive and live API for all the API endpoints is available at <http://jaspar.genereg.net/api/v1/live-api>.

3 Discussion

The JASPAR RESTful API can be used to query TF binding profiles and associated data from the JASPAR database programmatically, using numerous programming languages. Moreover, the API's web browsable interface brings an easy interface to bioinformatics tool developers.

Several third-party API clients have been developed to communicate with RESTful APIs. API clients handles the underlying details of how network requests are made and how responses are decoded. We are using Core API (<http://www.coreapi.org/>), which is a format-independent Document Object Model for representing web APIs. Core API comes with clients for command line, Python, and JavaScript. It is recommended to use these clients for more robust and meaningful interactions with the JASPAR RESTful API rather than constructing HTTP GET requests and decoding responses. More details about the clients are available on the API website.

The REST architecture has been demonstrated as a sustainable and reliable way to distribute genomic data to many programming languages. In the future, we plan to implement non-disruptive features to the API, such as: adding new endpoints, data fields, and filtering methods. All the disruptive changes will be released as a new version. We will make sure to keep the JASPAR RESTful API up-to-date and functional at any time to avoid any disruption to the tools based on this web service.

Acknowledgements

We thank all JASPAR collaborators for their useful suggestions and testing the API, and Georgios Magklaras for IT support.

Funding

This work has been supported by the Norwegian Research Council, Helse Sør-Øst, and the University of Oslo through the Centre for Molecular Medicine Norway (NCMM), which is part of the Nordic European Molecular Biology Laboratory partnership for Molecular Medicine.

JASPAR RESTful API: accessing JASPAR data from any programming language

Aziz Khan¹ and Anthony Mathelier^{1,2}

¹Centre for Molecular Medicine Norway (NCMM), Nordic EMBL Partnership, University of Oslo, 0349 Oslo, Norway, ²Department of Cancer Genetics, Institute for Cancer Research, Oslo University Hospital Radiumhospitalet, 0372 Oslo, Norway

API Overview

The JASPAR RESTful API provides programmatic and human-browsable access to the JASPAR database, and is implemented in Python by using the Django REST Framework.

API Documentation

A detailed documentation of the API with sample calls in different programming languages is available at <http://jaspar.genereg.net/api/v1/docs>. An interactive and live API for all the API endpoints is available at <http://jaspar.genereg.net/api/v1/live-api/>.

API Versioning

Currently, the JASPAR RESTful API has version 1, available at <http://jaspar.genereg.net/api/v1>. New versions will be released with new URLs with prior notice before obsoleting any older API version.

Throttling

Our API is using throttling in order to control the rate of requests that clients can make to the API. We allow **25** requests per second from the **same IP address**, but no limit on the total number of requests.

Please feel free to contact us if you need higher request.

Pagination

To provide a faster response to each request and to prevent larger accidental downloads, the API provides pagination. Users can increase or decrease the number of records per pages by setting the **page_size parameter**. By default **page_size=10**, which can be increased up-to **100**.

```
http://jaspar.genereg.net/api/v1/matrix/?page=1&page_size=25
```

Further, to jump from one page to another, specify the **page** parameter.

```
http://jaspar.genereg.net/api/v1/matrix/?page=2
```

Ordering

The requests support a simple query parameter controlling the ordering of results. The query parameter is named **order**.

```
http://jaspar.genereg.net/api/v1/matrix/?order=name
```

For example, to order matrices by name:

The client may also specify reverse order by prefixing the field name with '-', like so:

```
http://jaspar.genereg.net/api/v1/matrix/?order=-name
```

Multiple orderings may also be specified:

```
http://jaspar.genereg.net/api/v1/matrix/?order=name,version
```

Output formats

The JASPAR RESTful API provides several data renderers types, allowing to return responses with various media types. The query parameter is named **format**.

Currently, available data formats are: **json**, **jsonp**, **jaspar**, **meme**, **transfac**, **pfm**, **api** and **yaml**.

For example, to return all the matrices in **JSON** format:

```
http://jaspar.genereg.net/api/v1/matrix/?format=jaspar
```

This request will return something like this:

```
{
  "count": 2049,
  "next": "http://jaspar.genereg.net/api/v1/matrix/?page=2",
  "previous": null,
  "results": [
    {
      "matrix_id": "MA0001.1",
      "name": "AGL3",
      "collection": "CORE",
      "base_id": "MA0001",
      "version": "1",
      "sequence_logo": "http://hfaistos.uio.no:8000/static/logos/MA0001.1.png",
      "url": "http://jaspar.genereg.net/api/v1/matrix/MA0001.1/"
    },
    {
      "matrix_id": "MA0002.1",
      "name": "RUNX1",
      "collection": "CORE",
      "base_id": "MA0002",
      "version": "1",
      "sequence_logo": "http://hfaistos.uio.no:8000/static/logos/MA0002.1.png",
      "url": "http://jaspar.genereg.net/api/v1/matrix/MA0002.1/"
    },
    // 8 profiles more
  ]
}
```

The matrix list endpoint returns multiple profiles with pagination and has the following extra fields:

- **count**: total number of profiles for the matching query
- **next**: url to get the next page profiles results. It will be null for the last page
- **previous**: url to get the previous page profiles results. It will be null for the first page
- **results**: results of the matching query.

Further, to return PFM values of matrix **MA0001.1** in JASPAR format:

```
http://jaspar.genereg.net/api/v1/matrix/MA0001.1?format=jaspar
```

The above URL will return:

```
>MA0001.1 AGL3
A [ 0.00  3.00 79.00 40.00 66.00 48.00 65.00 11.00 65.00  0.00]
C [94.00 75.00  4.00  3.00  1.00  2.00  5.00  2.00  3.00  3.00]
G [ 1.00  0.00  3.00  4.00  1.00  0.00  5.00  3.00 28.00 88.00]
T [ 2.00 19.00 11.00 50.00 29.00 47.00 22.00 81.00  1.00  6.00]
```

You can set the output format type in three different ways:

1. By setting **?format=format** url parameter. For example:

- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=json>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=jsonp>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=yaml>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=api>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=jaspar>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=meme>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=transfac>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1/?format=pfm>

2. By adding **.format** suffix. For example:

- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.json>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.jsonp>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.yaml>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.api>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.jaspar>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.meme>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.transfac>
- <http://jaspar.genereg.net/api/v1/matrix/MA0001.1.pfm>

3. By using the [Accept headers](https://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html) (<https://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html>).

For example:

```
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: application/json'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: application/javascript'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: application/yaml'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: text/html'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: text/jaspar'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: text/meme'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: text/transfac'  
curl 'http://jaspar.genereg.net/api/v1/matrix/MA0001.1' -H 'Accept: text/pfm'
```

API Endpoints

All the endpoints available in the current version of the API are listed in Table S1.

API ROOT: <http://jaspar.genereg.net/api/v1>

Table S1: A detailed summary of API endpoints

Method	Endpoint	Parameters	Description
GET	/matrix	Required: None Optional: All the optional parameters are listed in table S2	Returns a list of all the matrix profiles.
GET	/matrix/:matrix_id	Required: matrix_id Optional:	Gets profile detail information
GET	matrix/:base_id}/versions	Required: bases_id Optional:	List matrix profile versions based on base_id
GET	collection/:collection	Required: collection Optional:	Returns a list of all matrix profiles based on collection name.
GET	/infer/:sequence	Required: sequence Optional:	Infer matrix profiles, given protein sequence

Table S2: Detailed list of optional parameters of API endpoint /matrix

Parameter	Description	Parameter Type	Data Type
page	A page number within the paginated result set.	query	integer
page_size	Number of results to return per page.	query	integer
search	Any search term.	query	string
order	Which field to use when ordering the results.	query	string
collection	JASPAR CORE or Collection name. For example: CNE	query	string
tax_group	Taxonomic group. For example: Vertebrates	query	string
class	Transcription factor class. For example: Zipper-Type	query	string
family	Transcription factor family. For example: SMAD factors	query	string
type	Type of data/experiment. For example: SELEX	query	string
version	If set to latest, return latest version	query	string
