Fig. S1: Contribution of age and type of SED activities after 9 pm to sleep duration during pre-school nights using Structural Equation Modeling
Age and time spent on each SED activity after 9 pm collectively explained $37.8 \%$ of the variance of the variable sleep duration. While age and time spent on computer, games, videos and social media after 9 pm had significant unique contributions to sleep duration (red arrows), time spent watching TV after 9 pm did not significantly affect sleep duration (dotted black arrow).
