Supplementary Figures

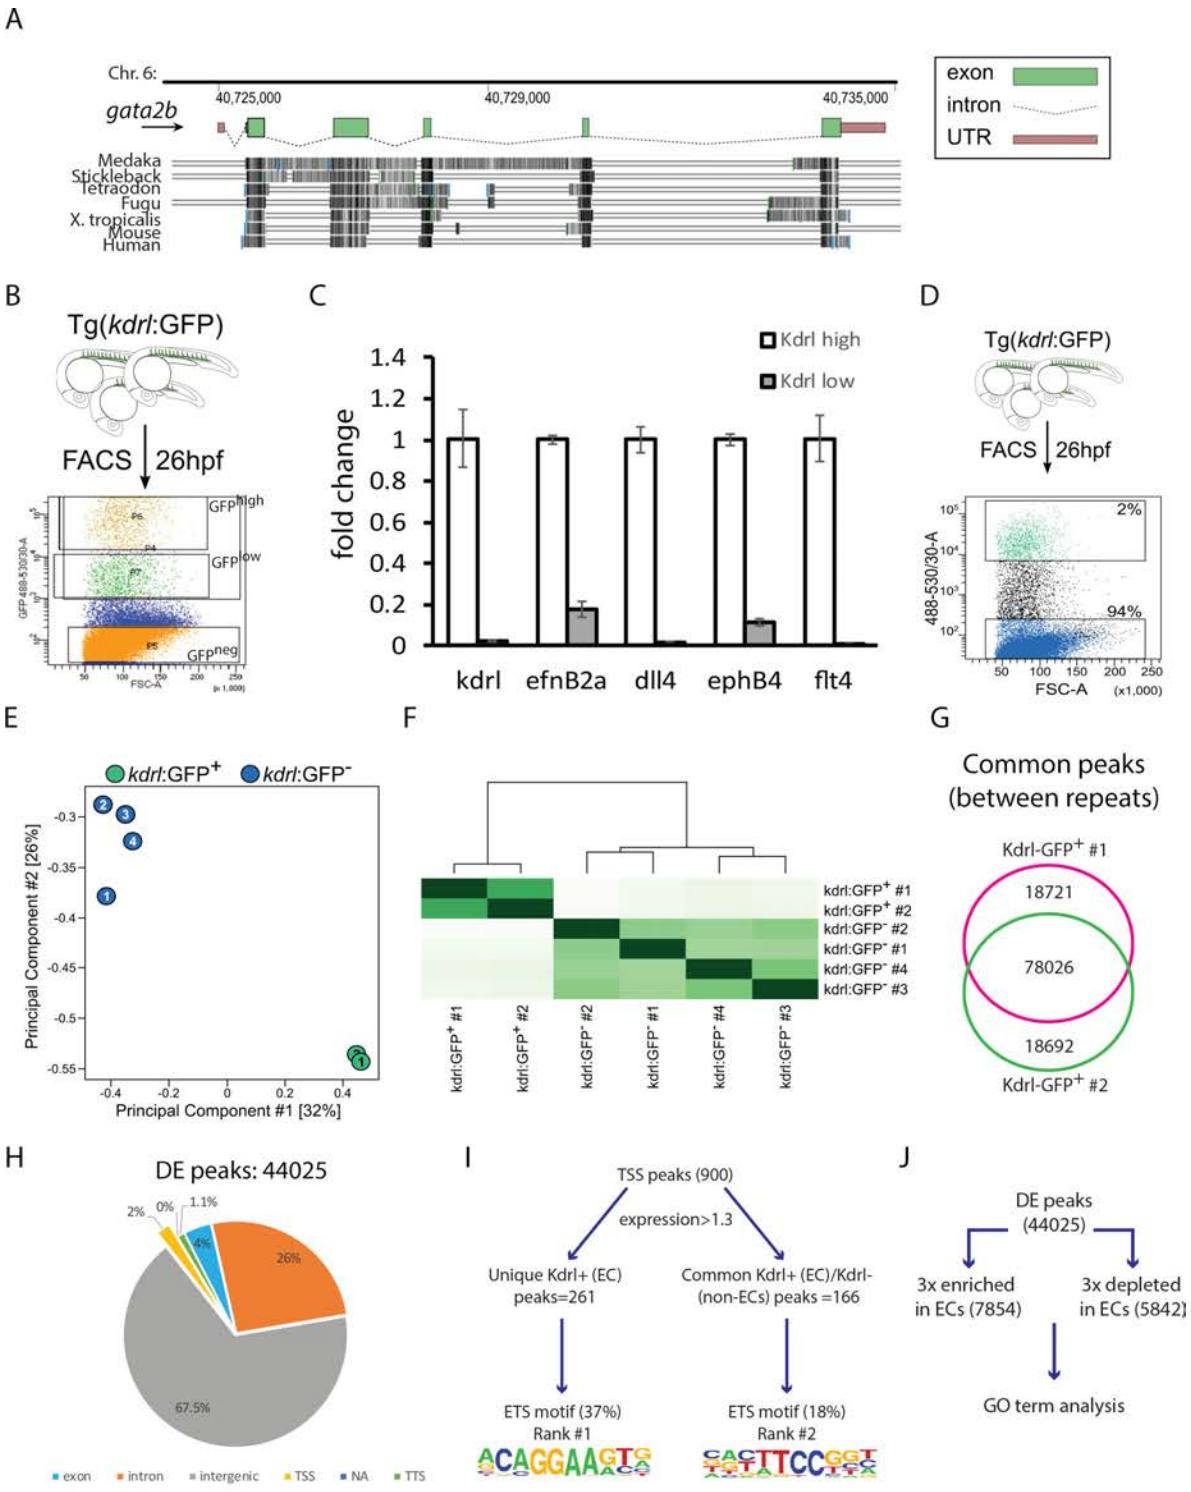

Figure S1. Preparation of ATAC-seq libraries from endothelial cells. (A) Overview of the zebrafish *gata2b* locus and genome alignment with other species, including mouse and human. Note the conservation within exon sequences in all the species used for comparison. Some intronic sequences are conserved only within fish species. (B) Schematic representation of the gating strategy to test expression of endothelial genes in two distinct *kdrl*:GFP^{+} cell populations: *kdrl*:GFP^{high} (orange, top panel) and Kdrl:GFP^{low} (green). (C) qPCR in kdrl:GFP^{high} and Kdrl:GFP^{low} cell populations, showing significant enrichment for endothelial-specific markers in the kdrl:GFP^{high} population. This population was selected for the ATACseq experiment and will be further referred to as *kdrl*:GFP^{+} for simplicity. (D) *Kdrl*:GFP^{+} (green) and *kdrl*:GFP^{-} (blue) cells were FACS-sorted from 26hpf embryos and used for preparation of ATAC-seq libraries. (E) Principal Component Analysis of 2 *kdrl*:GFP^{+} replicas and 4 *kdrl*:GFP^{-} replicas, showing strong separation of the two cell populations. The same numbers inside the circles denote replicas coming from the same FACS. (F) Clustering of the ATAC-seq samples showing high correlation between *kdrl*:GFP^{+} replicates and among *kdrl*:GFP^{-} replicas. The same numbers represent replicas coming from the same FACS. (G) Venn diagram showing 78026 common peaks between the *kdrl*:GFP^{+} ATACseq profile replicates. (H) Genome-wide distribution of the ATAC peaks from the differential peaks analysis. Note that most peaks are intergenic and intragenic; TSS peaks are only 2% of the total (44026 total peaks). (I) Differential peak analysis showing number of peaks at transcription start sites (TSS) and enrichment for ETS binding sites of the regions analysed. (J) Scheme depicting the strategy for the Gene Ontology (GO) term analysis using DAVID (Huang da et al., 2009).GO term analysis was performed for genes associated to ATACseq peaks that were (J) >3-fold enriched in *kdrl*:GFP^{+} endothelial cells (ECs) or (L) >3-fold depleted in *kdrl*:GFP^{+} cells.

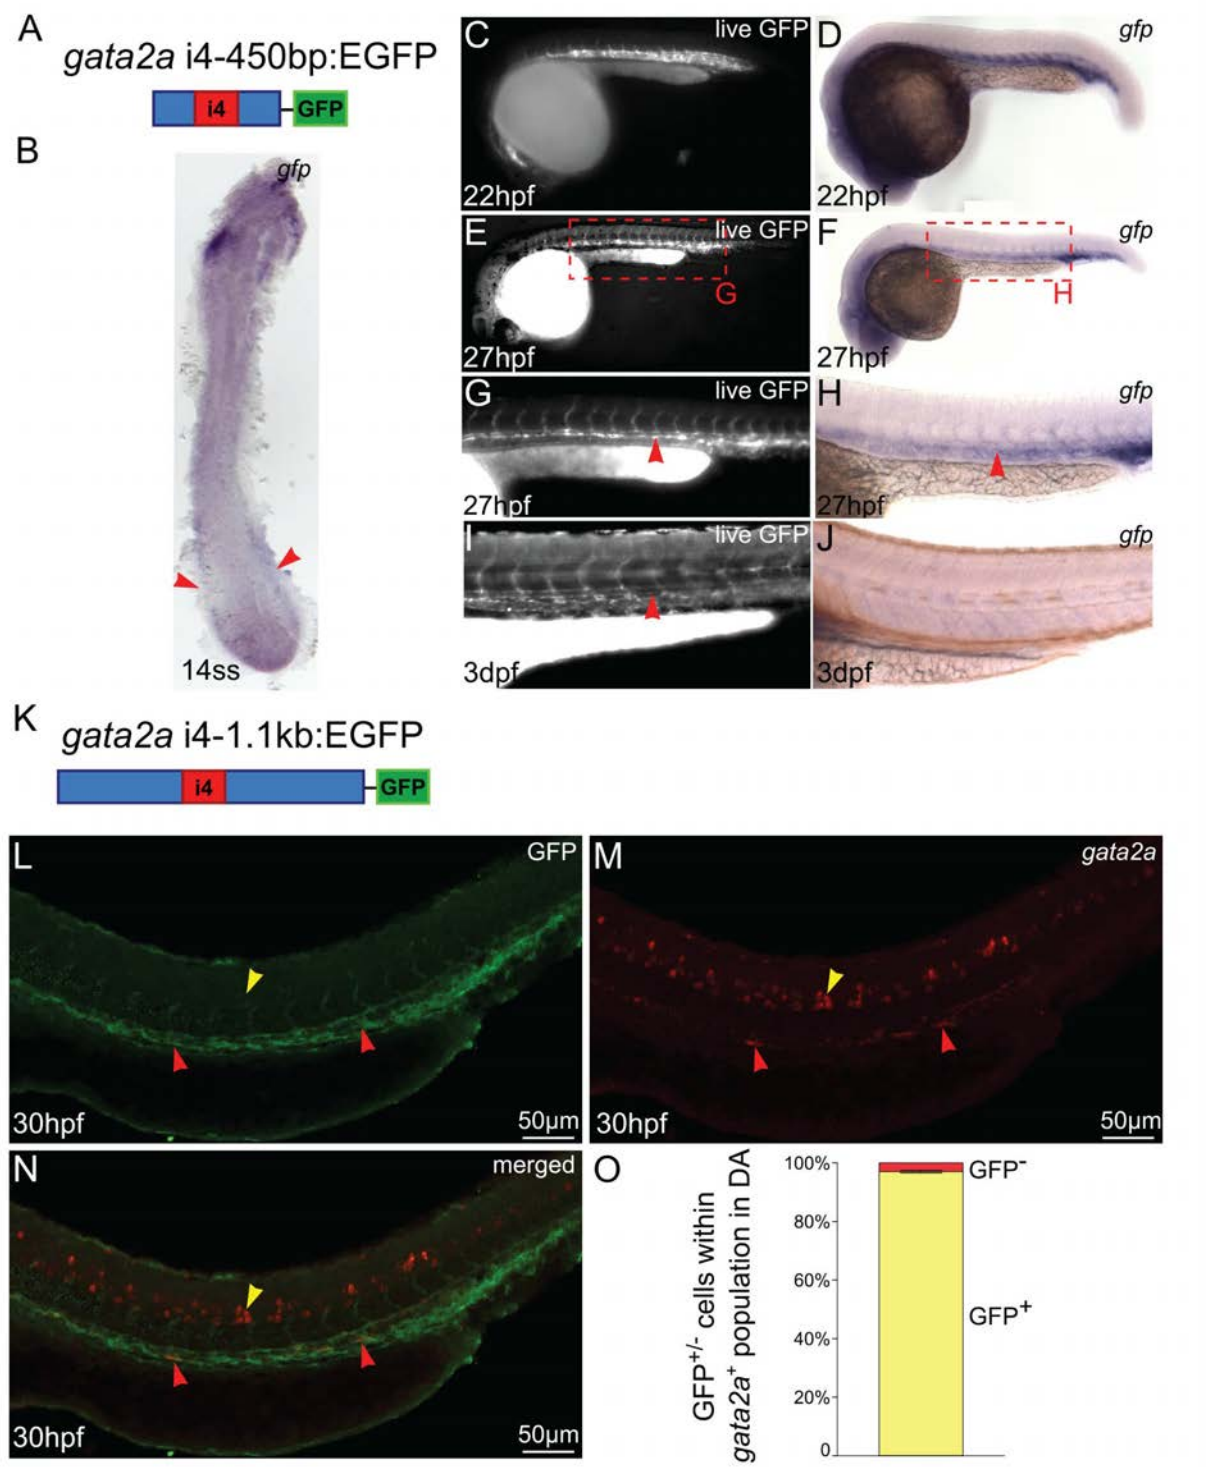

Figure S2. *Gata2a*-i4 enhancer drives GFP expression in PLM, DA and endothelial cells. (A) Schematic representation of the construct used to generate the Tg(*gata2a*-i4-450bp:GFP) transgenic line. (B) *In situ* hybridization of a 14-somite Tg(*gata2a*-i4-450bp:GFP) embryo (flat mount) shows *gfp* mRNA expression in the posterior lateral plate mesoderm (arrowheads), visible over high background staining in the yolk. (C,D) Fluorescent image of a live Tg(*gata2a*-i4-450bp:GFP) embryo and *in situ* hybridization image of the same embryo probed for *gfp* mRNA at 22hpf reveal activity of the i4 enhancer in the forming dorsal aorta. GFP is also present in the heart. (E-H) At 27hpf, GFP protein was detected in the endothelial cells and is particularly strong in the dorsal aorta (arrowhead

in panel G). *In situ* hybridization reveals high degree of overlap between *gfp* RNA and protein expression. (G-H) magnified trunks of embryos in panels H and K as indicated. (I-J) By 3dpf, GFP protein persists in the dorsal aorta (arrowhead) and other endothelial cells, but *gfp* mRNA is undetectable by *in situ* hybridization. (K) Schematic representation of the construct used to generate the Tg(*gata2a*-i4-450bp:GFP) transgenic line. (L-N) Confocal images of the trunk of a Tg(*gata2a*-i4-1.1kb:GFP) embryo immunostained with anti-GFP antibody (L) and probed for *gata2a* mRNA (M) at 30hpf, showing an overlap of GFP and *gata2a* in the DA (red arrowheads) but lack of GFP expression in the *gata2a*$^{+}$ neural tube (yellow arrowhead). (N) Merged images from panels L-M. (O) Counting of the *gata2a*$^{+}$ cells represented in panels L-N in 9 embryos shows that >95% of *gata2a*$^{+}$ cells in the DA are also GFP^{+}. N=2. Error bars: ±SD.

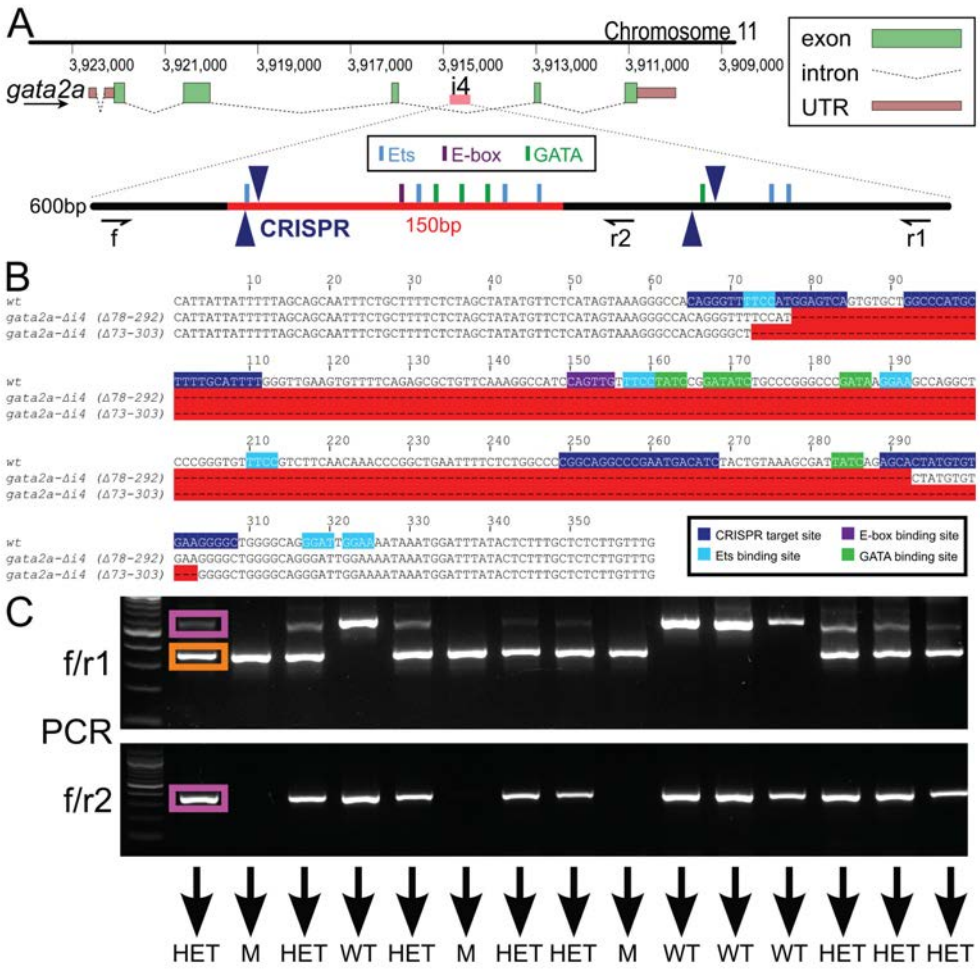

Figure S3. Generation of *gata2a* $^{\Delta i4}$ zebrafish mutants with CRISPR/Cas9. (A) Two pairs of CRISPR sgRNAs (dark blue) were designed to flank the highly conserved 150bp region within the *gata2a*-i4 enhancer. Approximate binding positions of diagnostic PCR primers f, r1 and r2 are indicated. Light blue: Ets binding sites; purple: E-box binding sites; green: GATA binding sites (mapped computationally). (B) Two isolated mutant alleles (Δ78-292 and Δ73-303) carry deletions (red gaps) including the majority of highly conserved transcription factor binding sites. (C) Genotyping of embryos from the incross of two *gata2a*$^{+/\Delta i4}$ mutants with PCR relies on the identification of bands specific to wild type alleles (pink) and the mutant-specific band (orange). Primers f, r1 and r2 are the same as in panel A. The first lane from the left in each gel: 100bp marker. WT: wild type; HET: heterozygote; M: mutant.

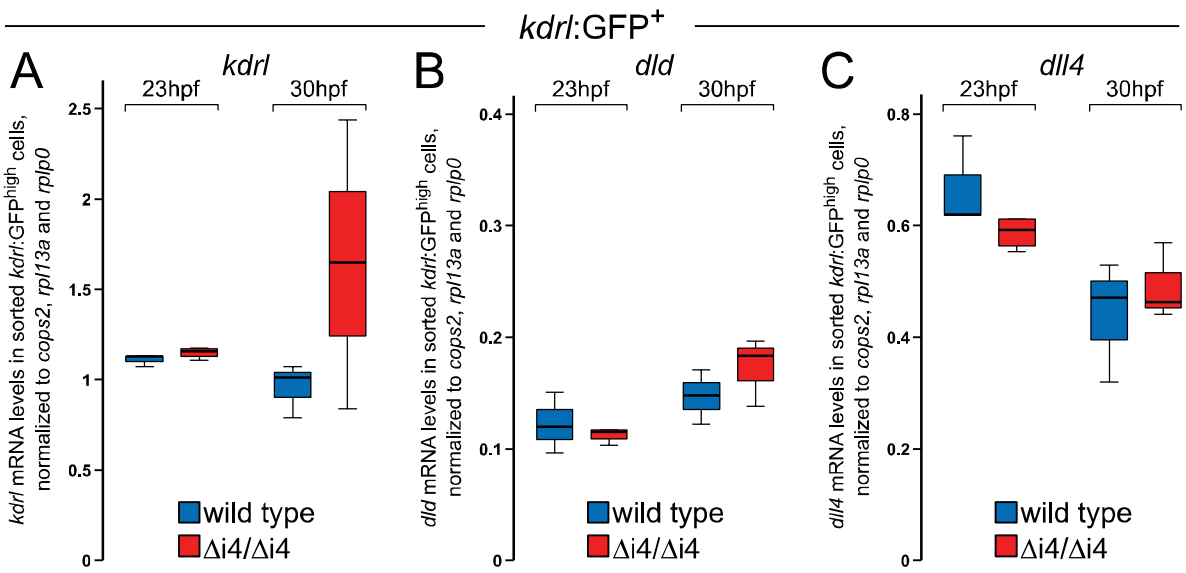

Figure S4. Expression of endothelial markers is unchanged in *gata2a*$^{\Delta i4/\Delta i4}$ mutants. qRT-PCR in sorted *kdrl*:GFP^{+} cells from wt (blue) and *gata2a*$^{\Delta i4/\Delta i4}$ mutants (red) shows no differences in the levels of *kdrl* (A), *dld* (B) and *dll4* (C) mRNA in the endothelium of *gata2a*$^{\Delta i4/\Delta i4}$ mutants at 23hpf and 30hpf, compared to wild type. N=4 for *gata2a*$^{\Delta i4/\Delta i4}$ at 23hpf, N=3 for other samples.

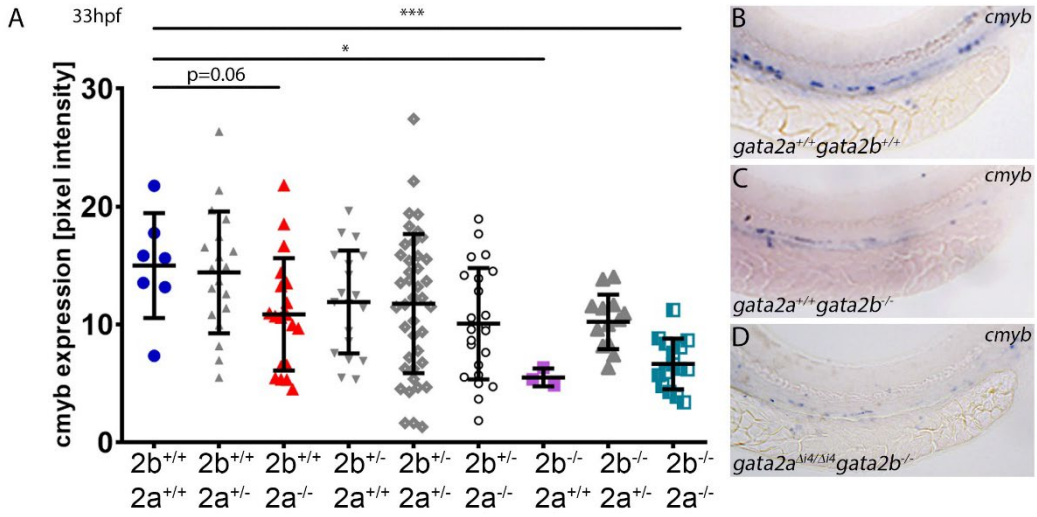

Figure S5. Analysis of *cmyb* expression in single *gata2a*$^{\Delta i4/\Delta i4}$, gata2b$^{-/-}$ and *gata2a*$^{\Delta i4/\Delta i4}$;gata2b$^{-/-}$ mutants at 33hpf. (A) Quantification of *cmyb* expression in embryos of all genotypes from a *gata2a*$^{\Delta i4/+}$;gata2b$^{+/-}$ incross (numbers of embryos are shown on the panel). Pixel intensity of *cmyb in situ* hybridization staining was performed as described (Dobrzycki et al., 2018). The expression levels in wildtype, single mutants and double mutant are shown in colour to better highlight the differences. Embryo numbers were n=7, wild type; n=19, *gata2a*$^{\Delta i4/+}$; n=17, *gata2a*$^{\Delta i4/\Delta i4}$; n=19 *gata2b*$^{+/-}$; n=42 *gata2a*$^{\Delta i4/+}$; *gata2b*$^{+/-}$; n=23 *gata2a*$^{\Delta i4/\Delta i4}$; *gata2b*$^{+/-}$; n=3 *gata2b*$^{-/-}$; n=13 *gata2a*$^{\Delta i4/+}$; *gata2b*$^{-/-}$; n=15 *gata2a*$^{\Delta i4/\Delta i4}$; *gata2b*$^{-/-}$. Error bars: mean±SD. *p<0.05; ***p<0.001 (B) Representative image of *cmyb* expression in the trunk of 33hpf wildtype, (C) gata2b$^{-/-}$ and (D) *gata2a*$^{\Delta i4/\Delta i4}$;gata2b$^{-/-}$ mutants.

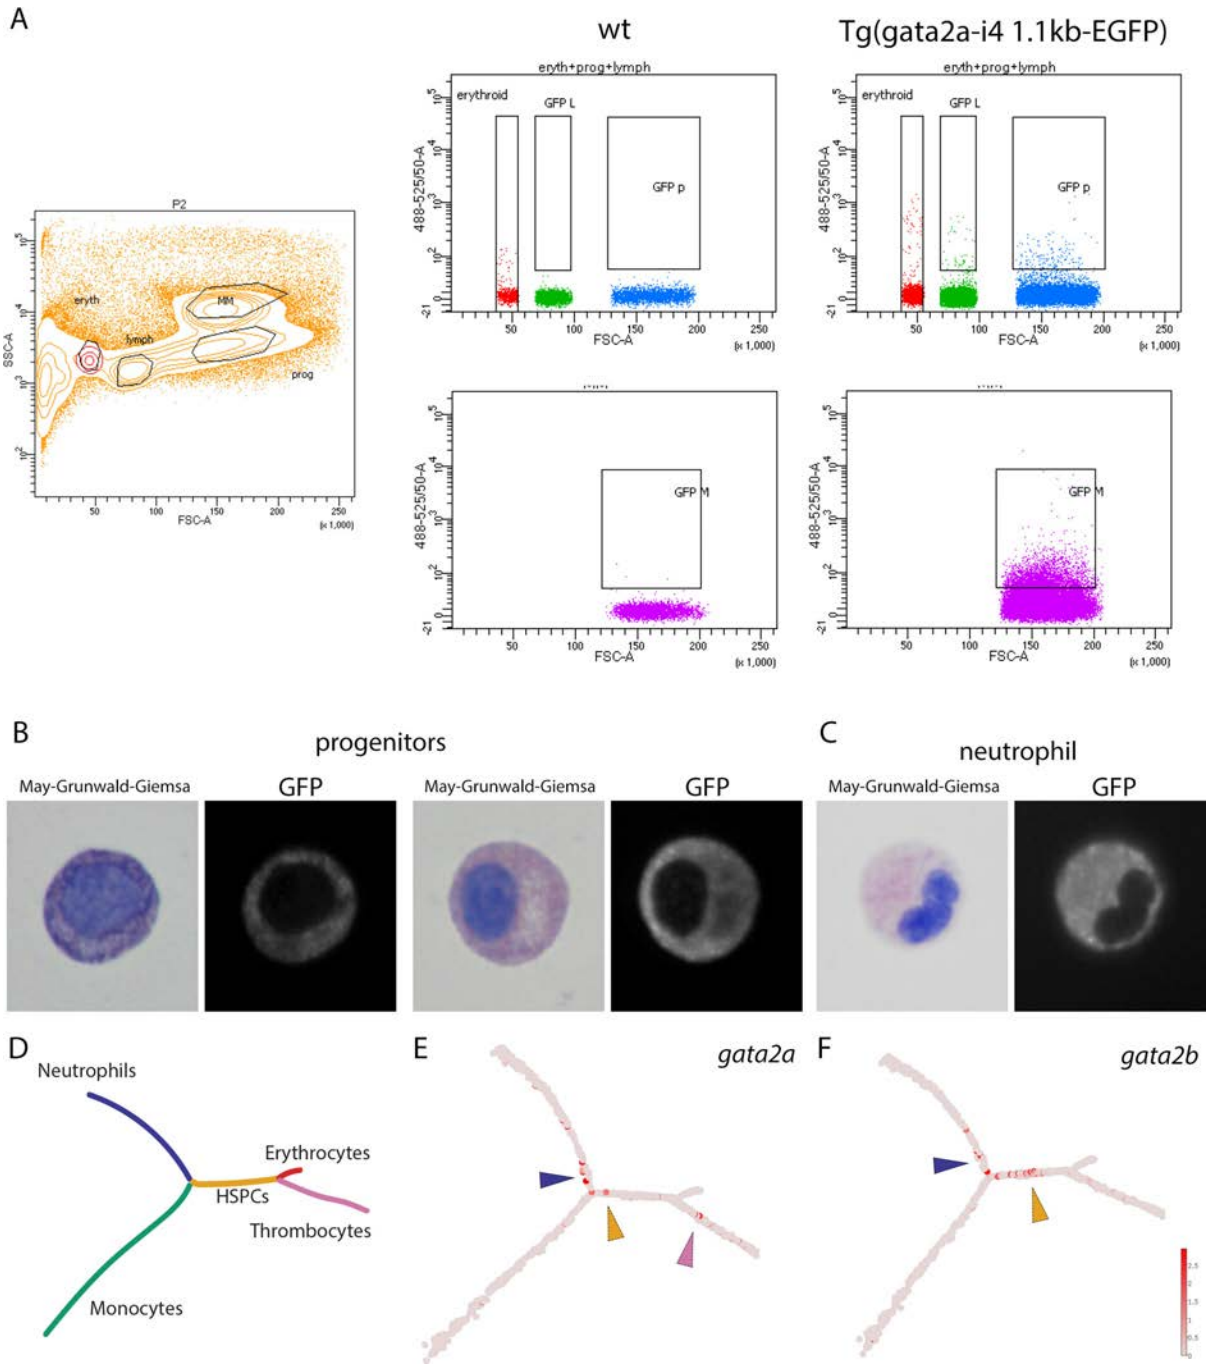

Figure S6. Flow cytometry analysis of GFP expression in Tg(gata2a-i4-1.1Kb:GFP) adult zebrafish. (A) Plot showing the distribution of cell size (forward scatter) vs granularity (side scatter) to distinguish the various haematopoietic cell populations in the WKM as described (Traver et al., 2003). The panels on the right show the gate settings to detect GFP+ cells in the lymphoid gate (GFP L), progenitor gate (GFP p) and myeloid gate (GFP M). Gata2a-i4-driven expression of GFP was found in all the gates examined. Examples of haematopoietic progenitors expressing GFP in (B) and (C) neutrophils, after May-Grunwald/ Wright-Giemsa staining. (D) Monocle trajectory representing the differentiation path for 5 major cell types in the WKM based on gene expression differences (adapted from (Athanasiadis et al., 2017)). The colours represent each of the branches differentiating from the HSPC 'root'. (E, F) Expression summary for (E) *gata2a* and (F) *gata2b* from

single cell RNA-seq data superimposed on the Monocle trajectory. The data is publicly available and was obtained from the BASiCz - Blood Atlas of Single Cells in zebrafish website (https://www.sanger.ac.uk/science/tools/basicz) (Athanasiadis et al., 2017). (E) *gata2a* expression was detected in single cells in the neutrophil (blue arrowhead), HSPC (yellow arrowhead) and thrombocyte branch (pink arrowhead). (F) *gata2b* expression was detected in single cells mainly in the neutrophil (blue arrowhead) and HSPC (yellow arrowhead) branches. Expression levels are shown from red to pink (high to low). HSPCs – haematopoietic stem and progenitor cells
