

Figure S1. Scree plot of multi-dimensional scaling analysis.

There are major and minor drops after four and eleven dimensions indicating these values to be reasonable choices for the number of included components in the logistic regression analysis-based GWAS.

*Figure S2.* Q-Q plots of GWAS analysis using univariate models.

Q-Q plots of GWAS analysis in low, moderate and high LD datasets using GEMMA, the clustering approach in PLINK, FaST-LMM implemented in pyseer using phylogeny-based distances, FaST-LMM implemented in pyseer using variant-based distances, and dimensionality-reduction approach in SEER.
