Figure S6: Gene models for cortex are shown for both *H. erato* and *H. melpomene*. Red arrows indicate positions of sgRNAs that were genotyped in CRISPR experiments. Recovered sequences showing evidence of editing as a result of CRISPR mutagenesis are shown. Target sequences are shown in blue and PAM site highlighted in bold. For *H. erato* exon 2, we recovered a sequence containing a 7bp insertion (indicated with red arrowhead, I2).
