## Supplementary Information: Benchmarking challenging small variants with linked and long reads

Supplementary Table 1: Comparison of v4.1 to v3.3.2 using hap.py with v2.0 genome stratifications are available in

SupplementaryTable1_HG002_GRCh37_1_22_truth_v4.1_in_benchmark_query_v3.3.2_in_ben chmark_stratification.extended.xlsx

Supplementary Figure 1: New benchmark set for GRCh37 covers more of the reference genome and includes more SNVs and indels.

Supplementary Table 2: Errors in v3.3.2 identified in (Wenger et al. 2019) that are updated now matching PacBio HiFi callset or removed from benchmark regions.

| Chromosome | Position | Result | Region Type |
| :---: | :---: | :---: | :---: |
| 4 | $11,468,804$ | Outside v4.1 benchmark regions |  |
| 5 | $42,740,225$ | Outside v.41 benchmark regions | LINE:L1PA2 |
| 2 | $5,143,996$ | Call matches in benchmark region |  |

| 13 | $48,291,499$ | Outside v4.1 benchmark regions | LINE:L1PA3 |
| :---: | :---: | :---: | :---: |
| 8 | $5,930,728$ | Outside v4.1 benchmark regions |  |
| 15 | $41,943,823$ | Outside v4.1 benchmark regions |  |
| 6 | $9,737,425$ | Outside v4.1 benchmark regions |  |
| 7 | $157,385,671$ | Reference call in benchmark regions |  |
| 17 | $32,064,214$ | Outside v4.1 benchmark regions |  |
| 1 | $94,256,825$ | Call matches in benchmark region | LINE:L1PA2 |
| 2 | $153,864,971$ | Call matches in benchmark region | LINE:L1HS |
| 4 | $112,819,087$ | Call matches in benchmark region | LINE:L1HS |
| 4 | $165,026,074$ | Call matches in benchmark region | LINE:L1PA2 |
| 11 | $23,338,682$ | Call matches in benchmark region | LINE:L1P1 |
| 1 | $35,034,071$ | Call matches in benchmark region | LINE:L1HS |
| 3 | $79,181,734$ | Call matches in benchmark region | LINE:L1HS |
| 4 | $94,532,444$ | Call matches in benchmark region | LINE:L1HS |
| 8 | $46,873,565$ | Outside v4.1 benchmark regions |  |
| 9 | $22,350,168$ | Call matches in benchmark region | LINE:L1PA2 |
| 21 | $42,288,851$ | Call matches in benchmark region | LINE:L1PA2 |

Supplementary Table 3: Benchmark set overlap of 163 difficult, medically-relevant genes in GRCh37. There are 10,152,047 bps in GRCh37 for medically-relevant genes that are difficult to sequence for short reads genes on the primary assembly for chromosomes 1-22.

| Benchmark Set | Coverage | SNVs | INDELS |
| :---: | :---: | :---: | :---: |
| v3.3.2 | $5,283,743(52.0 \%)$ | 6,364 | 997 |
| v4.1 | $8,513,217(83.9 \%)$ | 10,957 | 1,483 |

## Supplementary Figure 2: GRCh37 v4.1 coverage of difficult, medically-relevant genes.

Supplementary Table 4: Long PCR and Sanger sequencing results for confirmation of challenging variants. We confirmed all new variants covered cleanly by Sanger sequencing in 10 challenging genes and 4 challenging LINEs, affirming the accuracy of v4.1 in these new difficult regions.

|  | Total Variants <br> Covered by <br> Sanger | Total Variants <br> Covered by LR <br> PCR | Variants NOT <br> Covered by <br> Sanger | Variants <br> Covered but <br> Not Confirmed <br> by Sanger | Notes |

Supplementary Table 5: Manual curation results of 10 random sites in HGOO2 v4.1 that match Category 1 SNVs in Platinum Genomes.

| Chromosome | Position | Curation | Notes |
| :--- | :--- | :--- | :--- |
| 16 | 18288432 | Selfchain/segdup | Many variants on one HP CCS, in selfchain/segdup |
| 19 | 54726776 | Selfchain/segdup | Cluster of variants in 10x/Illumina nearby and CCS <br> has more variants on one HP than the other. In <br> high depth selfchain/segdup that is smaller than <br> 10kb |
| 19 | 41379908 | Selfchain/segdup | Cluster of variants, in LINE:L1MA3. In depth 2 <br> segdup and depth 2 selfchain |
| 8 | 11872949 | Selfchain/segdup | Potential SV in segdup, since CCS and ONT have <br> clipped reads nearby. Cluster of CAT1 variants |
| 15 | 20360478 | Possible CNV | Likely CNV given CCS data and high coverage in <br> ONT. Several CAT1 variants in the region. |
| 8 | 7223157 | Selfchain/segdup | Cluster of CAT1 variants, in segdup and normal <br> Coverage but in a cluster of variants on one HP CCS <br> and ONT, so may be more complex |
| 15 | 20453992 | Possible CNV | Cluster of CAT1 variants, cluster of variants on one <br> HP CCS, and large change in coverage in CCS and |

|  |  |  | nearby SV |
| :--- | :--- | :--- | :--- |
| 7 | 149749666 | Possible CNV | Cluster of CAT1 variants. Large changes in <br> coverage in region in CCS data but overall looks <br> reasonable. |
| 15 | 20454464 | Possible CNV | Many CAT1 variants in region, large change in CCS <br> coverage in region, near what appears to be SV <br> that is excluded from v4.1 |
| 12 | 74899879 | Possible CNV | Somewhat elevated CCS coverage. In LINE:L1PA3. |

Supplementary Figure 5: The Benchmark Region NG_X is the benchmark region that contains at least $\mathrm{X} \%$ of the total bases covered by the benchmark region. This metric is the same as

Assembly NG50 except that benchmark region is used in place of contig length. The contiguity of the benchmark improves in v4 compared to v3.3.2 and Platinum Genomes.

Supplementary Figure 6: Base pairs in genomic regions excluded for all input variant call sets.

Supplementary Table 6: Errors in v3.3.2 GRCh38 corrected hap.py results are available in SupplementaryTable6_GRCh38_v3.3.2_corrections.xlsx

Supplementary Table 7: Problematic regions in GRCh38 v3.3.2 that were near or in the centromere.

## Supplementary Note 1: Benchmark Evaluation Call set Generation

## Variant callsets used in evaluation

## PacBio HiFi reads with GATK Haplotype Caller

HG002 HiFi reads from three publicly available datasets were aligned to the GRCh37 and GRCh38 references using the pbmm2 v0.10.0 with `--preset CCS`. Small variants were called with GATK v4.0.10.1 HaplotypeCaller with `--pcr-indel-model AGGRESSIVE` and `--minimum-mapping-quality 10`. Variants were filtered on the QD (Quality by Depth) value with GATK v4.0.10.1 Variant Filtration, such that:

- SNVs with $Q D<2$ are filtered
- Indels $>1$ bp with $Q D<2$ are filtered
- 1 bp Indels with $Q D<5$ are filtered

| Instrument | Insert <br> Size | SRA | FTP |

GRCh37 reference used for alignment:
ftp://ftp-trace.ncbi.nih.gov/1000genomes/ftp/technical/reference/phase2_reference_assembly_sequen ce/hs37d5.fa.gz
GRCh38 reference used for alignment:
ftp://ftp.ncbi.nlm.nih.gov/genomes/all/GCA/000/001/405/GCA_000001405.15_GRCh38/seqs_for_align
ment_pipelines.ucsc_ids/GCA_000001405.15_GRCh38_no_alt_analysis_set.fna.gz
https://github.com/PacificBiosciences/pbmm2
https://github.com/broadinstitute/gatk/releases/tag/4.0.10.1
PacBio Hifi reads using minimap2 with DeepVariant
A set of $\sim 80 x$ coverage PacBio CCS data was mapped to each reference:
minimap2 VN:2.15-r905
minimap2 -ax asm20 -t 32
(Note that the mapping of these files predates some improved recommendations for mapping to use pbmm2)

DeepVariant v0.8 with the PACBIO model was applied to the mapped files. The commands and workflow used are identical to the DeepVariant case-study:
https://github.com/google/deepvariant/blob/r0.8/docs/deepvariant-pacbio-model-case-study.md
No filtering is applied.

## PacBio HiFi reads re-aligned using Duplomap

HG002 HiFi reads aligned to the GRCh37 reference using Minimap2 were downloaded from ftp://ftp-trace.ncbi.nlm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/HG002_NA24385_son/Pa cBio_CCS_15kb_20kb_chemistry2/ and reads overlapping segmental duplications were realigned using a tool Duplomap (https://gitlab.com/tprodanov/duplomap) that used paralogous sequence variants to map reads with multiple possible alignment locations. Small variants were called from the realigned bam file using DeepVariant v. 0.8 with default parameters.

## 10x Genomics using Aquila local assembly

Aquila uses linked-read data for generating a high quality diploid genome assembly, from which it then comprehensively detects and phases personal genetic variation. Here, Aquila merged two link-reads libraries to generate WGS variant calls for NA24385. Assemblies and VCFs for this merged library L5 + L6 can be found at http://mendel.stanford.edu/supplementarydata/zhou_aquila_2019/. The raw linked-reads fastq files can be downloaded in the Sequence Read Archive and its BioProject accession number is PRJNA527321.

## Illumina TruSeq DNA PCR-Free reads with Illumina Dragen Bio-IT platform

Illumina PCR-Free reads ( $2 \times 250$ bp with 350 bp insert size) are downloaded from the public file server. Dragen 3.3.7 is used to perform alignment, variant calling, and filtering on GRCh37 and GRCh38 reference assemblies. Variant filtering is based on MQ (Mapping Quality), MQRankSum (Z-score From Wilcoxon rank sum test of Alt vs Ref read MQs), and ReadPosRankSum (Z-score from Wilcoxon rank sum test of Alt vs Ref read position bias) values. For SNVs, MQ < 30.0, MQRankSum <-12.5, or ReadPosRankSum <-8.0 are filtered out. For INDEL, ReadPosRankSum <-20.0 are filtered.

Illumina PCR-Free reads are downloaded from
ftp://ftp-trace.ncbi.nlm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/HGOO2_NA24385_son/NI ST_Illumina_2x250bps/reads/

Illumina TruSeq DNA PCR-Free reads with VG alignment and Illumina Dragen Bio-IT platform
Illumina PCR-Free read pairs ( $2 \times 250 b p$ with 350bp insert size) are downloaded from and extracted from
novoaligned bams that are hosted on the public file server. The process is based on aligning the HG002 to genome graphs that were constructed from HGOO3 and HGOO4 parental variants. All alignments are performed using Variation Graph Toolkit (VG) and variant calling is done using Dragen version 3.2. Default variant calling settings in Dragen 3.2 were used during GVCF and VCF variant calling. The methods used to convert graph alignments to linear alignments and parental graph construction are in the workflow defined on the vg_wdl GitHub repository.

The workflow used to process this data can be found here https://github.com/vgteam/vg_wdl/blob/master/workflows/vg_trio_multi_map_call.wdl

Illumina PCR-Free reads for the trio used in parental graph construction and HGOO2 alignment are downloaded from
ftp://ftp-trace.ncbi.nIm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/HG002 NA24385 son/NI ST Illumina $2 \times 250 \mathrm{bps} /$ novoalign bams/ ftp://ftp-trace.ncbi.nlm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/HG003 NA24149 father /NIST Illumina $2 \times 250$ bps/novoalign bams/
ftp://ftp-trace.ncbi.nIm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/HG004 NA24143 mothe r/NIST Illumina $2 \times 250 \mathrm{bps} /$ novoalign bams/

The population data used for initial graph alignments of the HGOO2 trio samples are based on the 1000 genomes phase 3 variant dataset and the GRCh37 reference genome.
http://ftp.1000genomes.ebi.ac.uk/vol1/ftp/release/20130502/ALL.wgs.phase3_shapeit2_mvncall_integr ated_v5b.20130502.sites.vcf.gz

## 10x genomics using LongRanger with GATK Haplotype Caller

These callsets, generated independently for each individual in the Ashkenazi trio, used LongRanger ${ }^{21}$ (version 2.2, code at https://github.com/10XGenomics/longranger) and GATK v4.0.0.0 as variant caller with default parameters on 10x Genomics linked-reads data for the family trio (84x, 70x, and 69x coverage for HG002 NA24385 son, HG003 NA24149 father, and HG004 NA24143 mother, respectively) against both GRCh37 and GRCh38. The vcf and bam files for each genome are under: ftp://ftp-trace.ncbi.nlm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/analysis/10XGenomics_C hromiumGenome_LongRanger2.2_Supernova2.0.1_04122018/

The variant curation used the 10x Genomics VCF from LongRanger 2.2 (SRA accession SRX2225480), which is available at:
ftp://ftp-trace.ncbi.nIm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/analysis/10XGenomics_C hromiumGenome_LongRanger2.2_Supernova2.0.1_04122018/GRCh37/NA24385_300G/NA24385.GRCh 37.phased_variants.vcf.gz

All samples were sequenced on the Illumina Xten at $2 \times 150 \mathrm{bp}$. The Ashkenazim trio was done using the v1 of the 10x library prep protocol.

This callset was generated using Sequel II 11 kbp HiFi reads aligned to the hs37d5 reference with pbmm2, publicly available here:
ftp://ftp-trace.ncbi.nlm.nih.gov/ReferenceSamples/giab/data/AshkenazimTrio/HG002_NA24385_son/Pa cBio_SequellI_CCS_11kb/. The variants were called by using Clair (v1) on these alignments.

Supplementary Table 9: Manual Curation Results are available in SupplementaryTable9_v4.1_ManualCurationResults.xlsx

Supplementary Figure 7: The benchmark and callset both make calls in this region where there is likely a large duplication in HG002 compared to GRCh38 that was not detected by our exclusion criteria. This specific example is a FP SNP in PacBio HiFi Duplomap DV where the benchmark region indicates a reference call at this location.

## Supplementary Note 2: Process from v4alpha to v4.1

The Genome in a Bottle Consortium has an iterative evaluation process to ensure new benchmarks are useful for assessing performance across diverse sequencing technologies and variant calling methods. The first version using PacBio HiFi and 10x Genomics data was v4alpha. In particular, GIAB found that some regions contained unreliable calls across technologies, and these regions were excluded from subsequent releases. In addition, the

PacBio HiFi data changed during releases as new data were collected, and the 10x Genomics data remained constant at $\sim 84 x$ coverage.

The v4alpha release used PacBio Sequel I HiFi $\sim 15$ kb reads at $\sim 28 x$ coverage, with the difficult regions below (Bold entries changed from v3.3.2):

| Difficult Region Description | Method Excluded From |
| :--- | :--- |
| All candidate structural variant regions from the <br> Son-Mother-Father Trio | All methods |
| All tandem repeats < 51bp in length | All methods except GATK from Illumina PCR-free, Complete <br> Genomics, and PacBio CCS DeepVariant |
| All tandem repeats > 51bp and < 200bp in length | All methods except GATK from Illumina PCR-free and PacBio CCS <br> DeepVariant |
| All tandem repeats > 200bp in length | All methods except PacBio CCS DeepVariant |
| Perfect or imperfect homopolymers > 10bp | All methods except GATK from Illumina PCR-free |
| Segmental duplications from Eichler et al. | All methods except 10X Genomics and PacBio CCS |
| Segmental duplications > 10Kbp from self-chain mapping | All methods except 10X Genomics and PacBio CCS |
| Regions homologous to contigs in hs37d5 decoy | All methods except 10X Genomics and PacBio CCS |
| Difficult to map regions for short reads | All methods except GATK from Illumina PCR-free and Complete <br> Genomics |
| Homopolymer > 6bp in length |  |

The v4beta release used PacBio Sequel I HiFi $\sim 15 \mathrm{~kb}$ reads at $\sim 28 \mathrm{x}$ coverage. Additionally, v4beta used additional tandem repeat files from UCSC, excluded the entire tandem repeat if any part was not in the benchmark BED, and changed the difficult regions below:

| Difficult Region Description | Method Excluded From |
| :--- | :--- |
| v0.6 SV Benchmark | All methods |
| Regions that are collapsed and expanded from GRCh37/38 <br> Primary Assembly Alignments (corrected) | All methods |
| Diploid assemblies exhibit more than 2 contigs aligned > 10kb | All methods |
| Intersected short and long read based copy number > 2.5 <br> (updated) | All Methods |
| Segmental duplications > 10Kb, Identity > 99\%, Count >5 | All methods |
| mrCaNaVar duplications > 10kb (052119) | All methods except 10X Genomics and PacBio CCS |
| Outliers from long read coverage | All Methods |
| LINE:L1Hs > 500 | All methods except lllumina MatePair, 10X Genomics, and PacBio <br> CCS |
| All Tandem Repeats > 10kb in length | All methods |

The v4.0 release used PacBio Sequel II HiFi ~11 kb reads at $\sim 32 x$ coverage, updated to DeepVariant v0.8.

The v4.1 release used PacBio Sequel II HiFi $\sim 15 \mathrm{~kb}$ and $\sim 20 \mathrm{~kb}$ reads at $\sim 52 \mathrm{x}$ coverage. The diploid assembly-based MHC benchmark was used for the MHC region in v4.1. We also added the difficult regions below:

| Difficult Region Description | Method Excluded From |
| :--- | :--- |
| Potential copy number variation including CCS and ONT <br> outlier and CCS, ONT, mrCanavar intersection | All methods |
| VDJ | All methods |
| Inversions | All methods |

The v4.2 release is the first for HGOO3 and HG004, and it used hifiasm to perform the assembly of PacBio HiFi reads in the MHC, and used dipcall with this assembly to call variants, including in segmental duplications that were previously not assembled properly. Since it represents complex variants as individual SNVs and indels, dipcall helps improve partial credit in some cases for variants that are only partially called correctly by the query callset. We also excluded entire homopolymers and tandem repeats in the MHC if they were not completely covered by the benchmark bed. Since calls were made for HGOO3 and HGOO4 in addition to HGOO2, we also performed a trio Mendelian analysis and excluded Mendelian violations from the benchmark regions for all individuals (except putative de novo variants in HGOO2 were not excluded from the benchmark regions).

Supplementary Table 10: Primer Sequences for Long-Range PCR are available in SupplementaryTable10_PrimerSequences.xlsx
