S_Figure 4. Density plots showing the distribution of cells based on proportion of transcripts of mitochondrial origin (left), and number of genes (right) plotted against the counts of sequencing reads in the 4 time-points after MCF7 drug treatment. The dotted line indicates the selected QC thresholds: mitochondrial gene expression above between 7.5 and 15%, and number of genes below 1000 or above between 4500 and 5500.
