Supplementary data 3: Expression of GPER in the breast cancer. IHC was performed on formalin fixed, paraffin embedded breast cancer tissue sections using, anti-GPER antibody. A total of 65 cases were analyzed. Representative images for staining of high (A), medium (B) and low (C) GPER expression are shown. The corresponding H-score for high, medium, and low groups was 290, 130, and 20, respectively. Images in the first column were taken under 20× objective and those in the second column were taken under 40× objective.
